Patent No. 6686176

GENERAL INFORMATION:

APPLICANT: BEASLEY, Ellen et al

TITLE OF INVENTION: ACID MOLECULES ENCODING HUMAN KINASE PROTEINS,

TITLE OF INVENTION: THEREOF

TITLE OF INVENTION: THEREOF

FILE REFERENCE: CLOU178

CURRENT APPLICATION USER: US/09/819,607

CURRENT FILING DATE: 2001-03-29

US-09-949-016-12371/c

Sequence 12371, Application US/09949016

Patent No. 6812399

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

TITLE OF INVENTION: UNMBER: US/09/949,016

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR PILING DATE: 2000-10-20

PRIOR PILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER: FSQ ID NOS: 207012

SOFTWARE: FSECEND NOS: 207012

SEQ ID NO 12371

LENGTH: 152145
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 15554, Application US/09949016

/ (AA) plants a
/ (AA) plants so caminata ssp. burmannicoides var. Calcutta
/ (AA) plants were obtained from the Banana Germplasm Bank at
Babla, Brazil (Musa Germplasm Information System - MGIS
accession number ITC0249). Prior to temperature stress
conditions, banana plants were maintained for 48 hours in
an environment chamber at 250c with 80% air hunidity, and
a 16 hour light/ 8 hour dark cycle. Leaf samples (H0) were
rise to 350c, samples were collected after one (H1), two
(H2) and three (H3) hours with the temperature raised to
450c, new samples were also collected after one (H4), two
(H5), three (H6), nine (H7), and 21 hours (H8) following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the change in temperature. Tissues were immediately frozen in liquid N and stored at -800C until total RNA extraction. Total RNA was isolated using the Plant RNA Reagent kit (Invitrogen). Total RNA preparations from the eight time point samples were combined in equivalent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           quantities. The resulting bulked sample (1 mg of total RNA) was then submitted to poly (A) + RNA purification using the FastTrack 2.0 mRNA Isolation Kit (Invitrogen). Full length cDNA enriched, non-normalized, cDNA ibraries were constructed with the Creator Smart cDNA library kit and cloned into the pDNR-LIB vector (Clontech)."

Life Technologies (a division of Invitrogen) members carried out full-length librairies construction: Temple G. Genoscope members carried out sequencing and annotation: Castelli Schachter V., Mury J.M., Jaillon O., Wincker P., Menard M., Cruaud C., Schachter V., Waissenbach J., Salanoubat M.

URGV INRA: Clepet C., Caboche M.
Annotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences). 5 prime and 3 prime are assembled with Phrap.

Definition of the terms used to describe the quality of the clone: The about 250 sequences. From the clone collection were sorted according to clones and clustered. If more than one contig was formed, the clone was designated 'Contamination'. The contigs and singletons were blasted against CDS plus pseudogenes from the TIGRYS annotation, and matches longer than 50 bp with 95 percent identity are reported as 'intron found'. The remaining terms for Seqhalysis describe the outcome of the evaluation of the CDS detected after pairwise alignment with CDS plus pseudogenes from the TIGRYS annotation file. The sequences or contigs for which a full CDS with or without STOP codon was detected, a BLASTP against all TIGRYS procein sequences was performed Pull perfect: 100 percent identity; full good: better than 95 percent identity over more than 95 percent of the sequence; partial good: better than 95 percent identity were less than 95 percent identity were less than 95 percent of the sequence; weak similarity: less than 95 percent identity over less than 95 percent of the sequence; on that the collection contains a few clones for which sequencing was not successful, which could have simple technical reasons.

Obviously, information about these clones is missing in the tracer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /dab host="E. coli DH5alpha"

/clone="Westerner powrsol; in the context of the EU-funded project REGIA (GL6-CT11999-00876, coordinator Javier Paz-Ares), a set of transcription factor ORFs was generated. The ORFs were produced in a decentralized way in the labs of the participants. Most of the ORFs were generated by RT-PCR using cDNA from various A. thaliana tissues as a template. Initially, it was planned to use yeast recombination to move the ORFs from the cloning vectors into target constructs. For this reason, a number of the clones contein 'REGIA tags' (RG tag1:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            project, the GATEWAY system became available and finally all ORFs were transferred into GATEWAY vectors. At the end of the REGIA project, the clones were collected as plasmid DNA. For end-sequencing at the DNA core facility of the MPI of Plant Breeding Research (ADIS; head: Bernd
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Weisshaar), the plasmids were re-transformed into DHSalpha, arrayed into 96-well plates and new plasmid DNA was prepared. Re-transformation proved to be difficult because a number of clones displayed poor growth. Data submission has been handled by GabiPD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Insert Length: 815 Std Error: 0.00

The invention relates to a recombinant ZCCT1 protein (Zn finger and CCT domain protein) coding sequence comprising a nucleic acid that hybridises to the barley ZCCT1 CDNA appearing as ADS19577. The patent also discloses the identification of to genes, vral identified as API (APETALA1) and cvar2 identified as ZCCT1 also has a duplicate gene ZCCT2, all three genes are consisted to chromosome Sa of one grained wheat, Triticum monococcum ZCCT1 is the repressor of API whose promoter contains a binding site for ZCCT1 termed the CArG box. Also included are a vector comprising the recombinant ZCCT1 protein comprising the recombinant CCC protein comprising the vector, a transgenic plant comprising the recombinant CCC ZCCT1 protein comprising the vector, a transgenic plant comprising the recombinant CCC ZCCT1 protein comprising the vector, a transgenic plant comprising the recombinant CCC ZCCT1 protein comprising the vector. A pransgenic plant comprising the vector attains a method for ZCCT1 protein comprising the vector attains and molecular marker for altering a plant's response to vernalisation and a molecular marker for Vrn2 derived from ADS19577. The genetic construct is an interference RNA construct that inhibits ZCCT1 activity and comprises an antiseñse construct that inhibits ZCCT1 activity and comprises an antiseñse construct that inhibits ZCCT1 activity and comprises an antiseñse construct acid sequence encoding a repression defective ZCCT1 protein operably linked to a promoter or a molecular marker for a repression defective ZCCT1 protein operably linked to a promoter or an antisefference and account of the protein construct in a construct or a molecular marker for a repression defective ZCCT1 activity and comprises an antiseñse construct that inhibits ZCCT1 activity and comprises an antiseñse construct that inhibits ZCCT1 activity and comprises an antiseñse construct that inhibits activity and comprise construct or a machod and a promoter or a machod and a promoter or a machod and a promoter or a machod and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                quence encoding a DNA binding defective ZCCTl protein to a promoter. The present sequence is a plant ZCCT cDNA
                                                                             New recombinant ZCCT1 protein coding sequence useful for altering a plant's (e.g., wheat, barley, rye, oats, or forage grasses) response vernalization or flowering times.
                                                                                                                                                                                                                                           Claim 1; SEQ ID NO 75; 115pp; English.

The invention relates to a recombinant acting to the invention relates to a recombinant and administration of the barley ZCT1 cDNA appearing as ADS1957. The patent also discloses to the identification of to genes, vini identified as ADI (APETALAL) and vini identified as ZCT1 controlling vernalisation of flowering in temperate grasses. ZCT1 controlling vernalisation of flowering in temperate grasses. ZCT1 controlling vernalisation of flowering in temperate grasses. ZCT1 is the repressor of API whose promoter contains a monococcum. ZCT1 is the repressor of API whose promoter contains a binding site for ZCT1 termed the CARG box. Also included are a vector comprising the recombinant ZCT1 protein coding sequence above, a cell comprising the recombinant ZCT1 protein coding sequence above, a cell activity as genetic construct that inhibits ZCCT1 protein coding sequence above (or a genetic construct that inhibits ZCCT1 activity, and a molecular marker for vira derived from ADS19577. The genetic construct is an interference RNA construct that inhibits ZCCT1 activity, anucleic acid sequence encoding a plant ZCCT1 protein operably linked to a promoter or a nucleic acid sequence encoding a DNA binding defective ZCCT1 protein operably linked to a promoter. The present sequence is a plant ZCCT cDNA

The invention relates to a recombinant ZCCT1 protein (Zn finger and CCT domain protein) coding sequence comprising an nucleic acid that hybridises co to the barley ZCCT1 CDNA appearing as ADS19577. The patent also discloses the identification of to genes, vrnl identified as API (APETALA) and vrn2 identified as ZCCT1 controlling vernalisation of flowering in temperate grasses. ZCCT1 also has a duplicate gene ZCCT2, all three genes have been localised to chromosome Sa of one grained wheat, Triticum monococcum. ZCCT1 is the repressor of API whose promoter contains a binding site for ZCCT1 termed the CArG box. Also included are a vector comprising the vector, a transgenic plant comprising the recombinant CCC comprising the vector, a transgenic plant comprising the recombinant CCC ZCCT1 protein coding sequence above (or a genetic construct that inhibits a ZCCT1 protein of API), a seed from the transgenic plant, a method for altering a plant's response to vernalisation and a molecular marker for vrn2 derived from ADS19577. The genetic construct is an interference RNA construct that inhibits ZCCT1 activity and comprises an antisense construct that inhibits ZCCT1 activity and comprises an antisense construct that inhibits ZCCT1 activity and comprises an antisense construct that inhibits ZCCT1 activity, an uccleic acid sequence encoding a DNA binding defective ZCCT1 protein companies is a plant ZCCT1 construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3060
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3120

```
domain protein) coding sequence comprising a nucleic acid that hybridises to the barley ZCCTI cDNA appearing as ADS19577. The patent also discloses the identification of to genes, vrnl identified as API (APETALAI) and vrn2 identified as ZCCTI controlling vernalisation of flowering in temperate grasses. ZCCTI also has a duplicate gene ZCCT2, all three genes monococcum. ZCCT1 is the repressor of API whose promoter contains a binding site for ZCCT1 termed the CArG box. Also included are a vector comprising the recombinant ZCCTI protein coding sequence above, a cell comprising the vector, a transgenic plant comprising the recombinant ZCCTI protein coding sequence above (or a genetic construct that inhibits ZCCTI repression of API), a seed from the transgenic plant, a method for ZCCTI repression, for ZCCTI repression of API), a seed from the transgenic plant, a method for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      altering a plant's response to vernalisation and a molecular marker for Vrn2 derived from ADS19577. The genetic construct is an interference RNA construct (RNA) that inhibits ZCCT1 activity, and comprises an antisense construct that inhibits ZCCT1 activity, a nucleic acid sequence encoding a repression defective ZCCT1 protein operably linked to a promoter or a nucleic acid sequence encoding a DNA binding defective ZCCT1 protein operably linked to a promoter. The present sequence is a plant ZCCT CDNA
                                                                                                                                                                                                                                                                                                                                                    New recombinant ZCCTl protein coding sequence useful for altering a plant's (e.g., wheat, barley, rye, oats, or forage grasses) response to vernalization or flowering times.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention relates to a recombinant ZCCTl protein (Zn finger and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 642 BP; 165 A; 206 C; 163 G; 108 T; 0 U; 0 Other;

The invention relates to a recombinant ZCCT1 protein (Zn finger and CCT domain protein) coding sequence comprising a nucleic acid that hybridises to the barley ZCCT1 cDNA appearing as ADS19577. The patent also discloses the identification of to genes, vrn1 identified as AP1 (APETALA1) and varn2 identified as ZCCT1 controlling vernalisation of flowering in temperate grasses. ZCCT1 also has a duplicate gene ZCCT2, all three genes have been localised to chromosome 5a of one grained wheat, Triticum

ZCCT1 protein coding sequence above (or a genetic construct that inhibits ZCCT1 repression of AP1), a seed from the transgenic plant, a method for altering a plant's response to vernalisation and a molecular marker for Vrn2 derived from ADS19577. The genetic construct is an interference RNA

monococcum. ZCCTI is the repressor of API whose promoter contains a binding site for ZCCTI termed the CArG box. Also included are a vector comprising the recombinant ZCCTI protein coding sequence above, a cell comprising the vector, a transgenic plant comprising the recombinant

                         construct that inhibits ZCCTl activity, a nucleic acid sequence encoding a repression defective ZCCTl protein operably linked to a promoter or a nucleic acid sequence encoding a DNA binding defective ZCCTl protein operably linked to a promoter. The present sequence is a plant ZCCT cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Archicarchicaccininaricaccicaaccaacracccaccacaranceccc

The invention relates to a recombinant ZCCT1 protein (Zn finger and CCT domain protein) coding sequence comprising a nucleic acid that hybridises to the barley ZCCT1 cDNA appearing as ABS1957. The patent also discloses the identification of to genes, vantl identified as ABI (APBTALA1) and vanz identified as ZCCT1 also has a duplicate gene ZCCT2, all three genes CCC temperate grasses. ZCCT1 also has a duplicate gene ZCCT2, all three genes have been localised to chromosome Sa of one grained wheat, Triticum monococcum. ZCCT1 termed the CATC box. Also included are a vector comprising the recombinant ZCCT1 protein coding sequence above, a cell comprising the vector, a transgenic plant comprising the recombinant ZCCT1 protein coding sequence above, a cell comprising the vector, a transgenic plant comprising the recombinant of ZCCT1 repression of API), a seed from the transgenic plant, a method for a tering a plant's response to vernalisation and a molecular marker for vernal derived from ADS19577. The genetic construct is an interference RNA construct that inhibits ZCCT1 activity and comprises an antisense construct that inhibits ZCCT1 activity, a nucleic acid sequence encoding a DNA binding defective ZCCT1 protein operably linked to a promoter. The present sequence is a plant ZCCT cDNA
                                                                                                                                                                                                                                                                                                                                                to
                                                                                                                                                                                                                                                                                                                                              rye, oats, or forage grasses) response
                                                                                                                                                                                                                                                                                                                           New recombinant ZCCT1 protein coding sequence useful for altering a

The invention relates to a recombinant ZCCTI protein (Zn finger and CCT domain protein) coding sequence comprising a nucleic acid that hybridises to the barley ZCCTI CDNA appearing as ADS19577. The patent also discloses the identification of to genes, vrn1 identified as API (APETALA1) and temperate grasses. ZCCTI controlling vernalisation of flowering in temperate grasses. ZCCTI controlling vernalisation of flowering in have been localised to chromosome 5a of one grained wheat, Triticum monococcum. ZCCTI is the repressor of API whose promoter contains a binding site for ZCCTI termed the CANG box. Also included are a vector comprising the recombinant ZCCTI protein coding sequence above, a cell comprising the vector, a transgenic plant comprising the recombinant ZCCTI protein coding sequence above, a cell comprising the vector, a transgenic plant comprising the recombinant ZCCTI protein coding sequence above (or a genetic construct that inhibits ZCCTI repression of API), a seed from the transgenic plant, a method for altering a plant's response to vernalisation and a molecular marker for

domain protein) coding sequence comprising a nucleic acid that hybridises to the barley ZCCT1 CDNA appearing as ADS19577. The patent also discloses to the identification of to genes, vnnl identified as API (APETALAL) and vnn2 identified as ZCCT1 controlling vernalisation of flowering in temperate grasses. ZCCT1 also has a duplicate gene ZCCT2, all three genes to the vernalised to chromosome Sa of one grained wheat, Triticum monococcum. ZCCT1 is the repressor of API whose promoter contains a binding site for ZCCT1 termed the CArG box. Also included are a vector comprising the recombinant ZCCT1 protein coding sequence above, a cell comprising the vector, a transgenic plant comprising the recombinant CZCT1 protein coding sequence above, a cell comprising a plant's response to vernalisation and a molecular marker for ZCCT1 repression of API), a seed from the transgenic plant, a method for altering a plant's response to vernalisation and a molecular marker for Vrn2 derived from ADS19577. The genetic construct is an interference RNA construct that inhibits ZCCT1 activity and comprises an antisense construct that inhibits ZCCT1 activity and comprises an antisense a repression defective ZCCT1 protein operably linked to a promoter or a nucleic acid sequence encoding a DNA binding defective ZCCT1 protein genomic DNA sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a recombinant ZCCTI protein (In finger and CCT domain protein) coding sequence comprising a nucleic acid that hybridises to the barley ICCTI cDNA appearing as ADS19577. The patent also discloses the identification of to genes, vrnI identified as API (APETALA1) and vrnI identified as ICCTI controlling vernalisation of flowering in temperate grasses. ICCTI also has a duplicate gene ICCTI, all three genes have been localised to chromosome 5a of one grained wheat, Triticum

monococcum. ZCCT1 is the repressor of AP1 whose promoter contains a binding site for ZCCT1 termed the CArG box. Also included are a vector comprising the recombinant ZCCT1 protein coding sequence above, a cell comprising the recombinant ZCCT1 protein coding sequence above, a cell zCCT1 protein coding sequence above (or a genetic construct that inhibits ZCCT1 repression of AP1), a seed from the transgenic plant, a method for altering a plant's response to vernalisation and a molecular marker for Vrn2 derived from ADS19577. The genetic construct is an interference RNA construct (RNA) that inhibits ZCCT1 activity and comprises an antisense construct that inhibits ZCCT1 activity, a nucleic acid sequence encoding a repression defective ZCCT1 protein operably linked to a promoter or a nucleic acid sequence encoding a pub hinding defective ZCCT1 protein operably linked to a promoter. The present sequence is a plant ZCCT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     479

The invention relates to a recombinant ZCCT1 protein (Zn finger and CCT domain protein) coding sequence comprising a NDS19577. The patent also discloses to the barley ZCCT1 CDNA appearing as ADS19577. The patent also discloses the identification of to genes, vrn1 identified as API (APETALA1) and vrn2 identified as ZCCT1 controlling vernalisation of flowering in temperate grasses. ZCCT1 also has a duplicate gene ZCCT2, all three genes are noncoccum. ZCCT1 is the repressor of API whose promoter contains a monococcum. ZCCT1 termed the CArG box. Also included are a vector comprising the recombinant ZCCT1 protein coding sequence above, a cell comprising the vector, a transgenic plant comprising the recombinant a zCCT1 protein coding sequence above, or a cell comprising a plant s response to vernalisation and a molecular marker for ZCCT1 repression of API), a seed from the transgenic plant, a method for altering a plant s response to vernalisation and a molecular marker for Vrn2 derived from ADS19577. The genetic construct is an interference RNA construct that inhibits ZCCT1 activity and comprises an antisense a repression defective ZCCT1 protein operably linked to a promoter or a nucleic acid sequence encoding a DNA binding defective ZCCT1 protein operably linked to a promoter. The present sequence is a plant ZCCT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2648

This invention relates to a novel DNA, designated Lhd4 and encoding a protein capable of delaying flowering in a plant. The invention is useful for delaying flowering of a plant, which comprises expressing the novel DNA within the cells of a plant, such as rice. The Lhd4 protein enables control of flowering time of a plant, such as rice, thus caushing efficient development and growth of an excellent variety. The present sequence is an Oryza sativa cDNA sequence which is claimed in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel DNA, designated Lhd4 and encoding a protein capable of delaying flowering in a plant. The invention is useful for delaying flowering of a plant, which comprises expressing the novel DNA within the cells of a plant, such as rice. The Lhd4 protein enables control of flowering time of a plant, such as rice, thus causing sequence is that of an growth of an excellent variety. The present exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         632
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               216 ATGTCGATGGGACCAGCAGCGGAGAAGGATGTGGCCTGTGCGGCGCCGACGGTGCGGC

This invention relates to a novel DNA, designated Lhd4 and encoding a protein capable of delaying flowering in a plant. The invention is useful for delaying flowering of a plant, which caparises expressing the novel DNA within the cells of a plant, such as rice. The Lhd4 protein enables control of flowering time of a plant, such as rice, thus causing sequence is an Oryza sativa CDNA sequence which is claimed in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  366 GTGCACGAGTTCCAGTTCTTC-----GGCAACGACGGCGGCGGCGACGACGAGGCGGCGAGAGC 419

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
